

# Single-line Systems for Commercial Vehicles

For fluid grease, NLGI grades 000, 00

- Cut wear and tear
- Reduce downtimes
- Lower maintenance costs with automatic lubrication

## Table of contents

			plastic tubing 10x1.5 diam.
			plastic tubing 4x0.85 diam.

## Lubricants and Centralized Lubrication Systems

See important product usage information on the back cover.

Centralized lubrication systems may only be used for their intended purpose. Centralized lubrication systems can normally be operated with the lubricants listed in the system's documentation as long as the latter comply with the respective consistency classes and viscosity limits within the indicated temperature range. It is possible for the demands on a lubrication system's configuration to vary in keeping with the lubricant and the use to which the installation is put.

Given the already high "apparent viscosity", we advise against the use of grease conforming to NLGI Grade 0 since it is possible for fundamental properties related to delivery of the lubricant to deteriorate considerably, particularly at low ambient temperatures. If, nevertheless, a lubricant conforming to NLGI Grade 0 is required, we recommend that its deliverability be checked.

### Suitable Lubricants

The lubricants must be suitable for the lubrication of bearings under the ambient conditions to be expected in operation. Our experience shows that corresponding lubricants are available from every well-known manufacturer. Please contact the supplier when you choose a suitable lubricant. SKF Lubrication Systems offers to test the deliverability of a selected lubricant in the event of doubt. Lubricants that meet the identical specifications of SKF Lubrication Systems Germany AG, Daimler AG and MAN AG match each other in terms of the parameters applying to their deliverability.

A corresponding lubricant can also be purchased from SKF Lubrication Systems Germany AG in 1 kg and 25 kg drums.

**1 kg drum, Order No. FL1-000<sup>1) 4)</sup>**  
**25 kg drum, Order No. FL25-000<sup>2)</sup>**

Biodegradable types of grease available from SKF Lubrication Systems Germany AG can also be used in centralized lubrication systems.

**1 kg drum, Order No. FL1-000BIO<sup>1)</sup>**  
**25 kg drum, Order No. FL25-000BIO<sup>2)</sup>**

To assure reliable operation of the centralized lubrication system always pay attention to cleanliness when topping up lubricant. Dirt will lead to malfunctions in a centralized lubrication system and to destruction of the friction points.

#### Lubricant manufacturers who are known to sell appropriate lubricants:

ARAL AG	Deutsche Shell GmbH	Reiner Chemische Fabrik GmbH
Autol-Werke GmbH	ELF	RHENUS
AVIA Mineralöl	Esso	Wilhelm Reiners GmbH & Co.
Axel Christiernsson	FINA	Siebert GmbH
BP Oil Deutschland GmbH	Georg Oest Mineralölwerke	Texaco
Calypsol	Mobil Schmierstoff GmbH	Veedol Int. Ltd., England
Castrol Ltd., England	Optimol	Winterhall AG
DEA	ÖMV GmbH	Zeller+Gmelin GmbH & Co.

<sup>1)</sup> Coupler for 1 kg drum, order No. KFU2.U8

<sup>2)</sup> Topping-up pumps for 25 kg drum, order No. 169-000-082 and 169-000-084

<sup>3)</sup> For units with grease follower

<sup>4)</sup> Filler bend for pumps with screw cap, order No. 169-000-037

## Systems for grease, NLGI grades 000, 00

- Electrically operated gear pump units KFU / KFUS
- Pneumatically actuated piston pump PEF-90
- Electrically operated piston pump KFB(S)1

### 1. Planning and installation

#### a) Determination of number of lubrication points.

All friction points of the chassis and any body units, with the exception of the universal joints of the cardan shaft

#### b) Determination of metered quantities.

The tabular values correspond to the average lubricant needs of the bearings in a vehicle weighing more than 8 tons.

The lubrication frequency depends on the type of operation.

Truck tractors	Metered qty. (cm <sup>3</sup> )	Trailers and semitrailers	Metered qty. (cm <sup>3</sup> )	Buses	Metered qty. (cm <sup>3</sup> )
1. Steering knuckle	0.4	1. Tow bar	0.4	1. Stop lever	0.1
2. Spring pin	0.4	2. Turntable	0.4	2. Dual lever	0.1
3. Spring suspension	0.4	3. Spring pin	0.4	3. Reversing lever	0.1
4. Brake shaft	0.2	4. Brake shaft	0.2	4. Idler arm	0.1
5. Brake shaft, wheel side	0.1	5. Brake shaft, wheel side	0.1	5. Linkage setting device	0.2
6. Linkage setting device	0.2	6. Linkage setting device	0.2	6. Brake shaft	0.2
7. Stabilizer	0.2	7. Hand brake	0.1	7. Brake shaft, wheel side	0.1
8. Driver's cab support	0.1	8. Spare wheel	0.1	8. Steering knuckle	0.4
9. Longitudinal control arm	0.2	9. Brake shoe pin	0.1	9. Turntable	0.4
10. Transverse control arm	0.2	10. Steering assembly	0.4	10. Drag link	0.4
11. Coupling	0.1	11. Support arms	0.1	11. Knuckle pin bearing	0.4
12. Gas control	0.1	12. Wearing plate	0.4	12. Axle support	0.4
13. Center bearing	0.4			13. Gas control	0.1
14. Fifth wheel support plate	0.4				

#### c) Calculation of system capacity

Maximum values:

Electrically operated gear pump units

KFU / KFUS ..... = 80 cm<sup>3</sup>

Pneumatically actuated piston pump

PEF-90 ..... = 36 cm<sup>3</sup>

Electrically operated compact unit

KFBS ..... Cf. diagram on page 21 for max. system capacity

Example of how to calculate the system capacity: \*)

20 lubrication points, 0.4 cm<sup>3</sup> each ..... = 8 cm<sup>3</sup>

10 lubrication points, 0.2 cm<sup>3</sup> each ..... = 2 cm<sup>3</sup>

10 lubrication points, 0.1 cm<sup>3</sup> each ..... = 1 cm<sup>3</sup>

11 cm<sup>3</sup>

+25% (safety margin) ..... = 2.75 cm<sup>3</sup>

Compressibility and expansion losses:

1 cm<sup>3</sup>/m main-line tube

(average value for steel and plastic tubing),

assumed:

12 m main-line tubing, 10 x 1 ..... = 12 cm<sup>3</sup>

.....Total \*\*) 25.75 cm<sup>3</sup>

#### d) Selection of distributors

Metered quantities of VKSO distributors: 0.1, 0.2 and 0.4 cm<sup>3</sup>.

Depending on tubing layout: 2-, 4- and 6-port VKSO distributors.

Two different distributors are connected to one manifold with a VKR 2.U2 connector

#### e) Tubing connections

Main line connections to VKSO distributors:

M16x1.5 thread for 10 mm diam. tube,

tapped for solderless tube connection.

Secondary (lubrication) line connections

to VKSO distributors: with plug-in connectors.

\*) The example applies only to KFU and PEF90 units. The safety margins for the KFB(S) units are already worked into the diagram.

\*\*) If the calculated system capacity exceeds the capacity of the pump unit, a second pump unit must be used. A second unit is also required when the vehicle is operated for extended periods of time at temperatures below -20 °C with a main-line train of more than 17 m.

### f) Installation

(Detailed installation instructions are available on request.)

This information is supposed to be a guideline and aid for the fitter. It will enable him to install the equipment on vehicles on his own, even if there are no tubing layouts available, or only incomplete ones.

**For the prevalent, standard types of commercial vehicles we have prepared tubing layouts according to which the installations are to be made.** If required, these layouts will be mailed free of charge.

Additional superstructures and special vehicles can be outfitted on the basis of these layouts.

The preassembled VKSO distributors for standard systems are supplied with a preset metered quantity, but they can be changed to another quantity of lubricant if necessary.

Install the VKSO distributors at suitable locations on the vehicle and connect to the tubing.

**Max. length of the secondary lines 6 m** (connection: distributor – lubrication point).

Tighten the socket unions, but do not overtighten (maximum of  $1\frac{1}{2}$  turns). The tapered sleeves and tubing are slightly deformed when tightened, thus offering no resistance – as a fixing bolt would when tightened.

**Attention must be paid to the following when installing the secondary lines:**

- Steering lock angle, sagging, chafing spots.
- Keep away from heat sources.

Install the pump and control unit at a suitable place.

Connect hoses and make electrical connections.

### Some installation hints:

- Use the existing holes drilled in the chassis and in other vehicle parts for the installation.
- Span large boreholes with body washers.
- Lay 4 x 0.85 plastic tubing (as per WVN716, flexible) between distributors and lubrication points.
- Use 734...-K hose lines to connect nonstationary lubrication points and lubrication points that are subject to heavy mechanical stress and strain.
- **The compressed air for the PEF-90 pneumatically actuated pump must be taken** from a line for auxiliary loads. The regulations of the TÜV (Technical Control Board) must be observed.
- **The pertinent Hazardous Goods Road Ordinance (GGVS) must be observed in the case of tank trucks and other vehicles carrying hazardous goods.**

The following can be used:  
electrically operated gear pump units KFU2-40, KFU6-20 in conjunction with cable harness 997-000-374; compact units KFB(S) in conjunction with cable harness 997-000-630 or 997-000-650.

Furthermore, the pressure switch line must likewise be laid in corrugated tubing

## 2. Operation and maintenance

In the case of automatically controlled systems, with the exception of KFB(S) compact units, the indicator light goes on for about 3 seconds every time the ignition is switched on. (See point 3 for response to malfunctions.)

For the most part, maintenance is limited to topping up with clean lubricant in good time.

All tube connections should be checked for a tight fit when the vehicle is inspected.

Replace torn or worn hose lines after eliminating the cause, and trigger test lubrication. Actuate automatic systems by hand and observe the indicator light.

The main line (connection: pump – distributor) is monitored by a pressure switch that reports the build-up of pressure. Exception: KFBS and KFUS units. If the indicator light does not light up, or if it burns constantly in the case of automatic systems, this means the pressure has failed to build up.

Select a smaller metered quantity for highly overlubricated points and a higher quantity for dry points.

If the entire system is overlubricated or underlubricated, there is a malfunction: in this case proceed in accordance with 3.b) or 3.c) respectively.

## 3. Malfunctions and their elimination

### a) Fault indication by indicator light.

The indicator light does not go out about 3 seconds after the ignition is switched on or the motor started.

**Check lubricant level in the reservoir;** top up lubricant if necessary and bleed the system.

**In the case of electrically operated gear pumps,** loosen the screw union of the main line while the pump is running. There must be a continuous discharge of lubricant.

**In the case of pneumatically operated systems:**

**Check the compressed air supply.** Minimum pressure is 6 bars.

**Check pump function.**

The piston stroke must be heard or felt when the compressed air is applied.

**Check pressure in main line.**

Loosen the lubrication-point connection and check whether the distributor is delivering lubricant. If it is, the fault must be looked for in the pressure switch, electrical wiring or control unit.

**Please note:**

The distributor will not feed lubricant until the main line is relieved of pressure again. It is therefore called a "relubrication distributor".

**Check electrical connections:**

Is power available?

Are all terminals tight?

Check the indicator light, solenoid valve, pressure switch and control unit.

Main line connections, main hose lines in particular, must be checked for leakage. Then check whether the **pump valves** are dirty.

**b) Entire system insufficiently lubricated.**

Install a pressure gauge in the main line and check the pressure build-up and relief. Min. pressure build-up is 30 bars.

A maximum residual pressure of 1 bar may remain after the pressure is relieved (measured at pump's outlet port).

**c) Entire system is overlubricated.**

Check setting of control unit and increase interval time if necessary.

**d) Individual lubrication points are over-lubricated or underlubricated.**

Change metered quantity.

**e) Distributor faults.**

Replace distributors.

**Please note!**

Absolute cleanliness must be maintained when doing any work on the system, especially when replacing metering nipples on distributors. Dirt in the system causes malfunctions.

Never use trichloroethylene, perchloroethylene or similar liquids aggressive to Perbunan when cleaning centralized lubrication systems.

Suitable cleaning agents are petroleum ether or kerosene.

## Pressure curve in main line in the case of systems with VKSO relubrication distributors

Pneumatically actuated piston pumps and electrically operated gear pump units have an identical pressure curve, but the time required for the pressure build-up will generally be shorter with pneumatically actuated piston pumps.

The maximum pressure reached in the main line depends on the actuating pressure of the piston pumps or on the pressure intensity of the safety valve in the case of gear pump units.

Pneumatically actuated piston pump ..... 22-50 bars  
Electrically operated KFU gear pump units ..... ≈ 38 bars  
Electrically operated KFBS compact units ..... ≈ 30 bars (length of main line limited to 10 m)

### Functional sequence

At the end of the preset interval time, the pump motor is switched on and the pressure required by the system built up. This is reported to the control unit by the actuation of the pressure switch. At the end of the pump running time the pump motor is switched off and a new interval time begins.

If there is no signal from the pressure switch while the pump is in operation, the control unit reports a fault at the end of the pump running time. This is signaled by the constant burning of the indicator light.

The metering chambers of the distributors are filled with lubricant during the pressure build-up in the main line.

The relief of pressure in the main line via the pressure relief valve starts when the pump is switched off. The lubricant from the metering chambers is delivered to the lubrication points by the springloaded distributor pistons at the same time as the pressure is relieved.

The KFB(S) compact units have the same functional sequence, but the pressure build-up is not monitored in this case.

## Gear pump units KFU2-40, KFU6-20, KFUS2-64 with reservoir, electrically operated

The gear pump unit consists mainly of a gear pump with relief valve, safety valve, DC motor, transparent lubricant reservoir, filler socket and angle bracket. The DC motor and filler socket are covered by a hood to protect them from dirt. The hood snaps into place on both sides of the reservoir lid.

### Function

The gear pump continuously supplies lubricant to the relubrication distributors via the main line network when the pump is in operation. As soon as the metering chambers of the distributors are full the excess lubricant flows back into the reservoir via the safety valve.

At the end of the pump running time (start of the interval time), the pressure relief valve opens so that the pressure in the main line can drop to a residual pressure of 0.2 to 1.0 bar. The springloaded pistons of the distributors can now deliver lubricant from the metering chambers to the lubrication points.

Nearly every size of system on commercial vehicles, including superstructures, can be supplied by one single pump when a KFU2-40 or KFU6-20 pump unit is used.

Furthermore, the semitrailer or trailer can be connected in the form of an interconnected system, but this is only advisable when the motor vehicle and semitrailer/trailer are rarely or never disconnected from each other.

The KFU units must be used with cable harness 997-000-374 on vehicles approved for the transport of hazardous goods by road (GGVS).

Associated cable harness for KFU, order No. 997-000-373;

cable harness for KFUS2-64, order No. 997-000-750.

## Piston pump PEF-90, pneumatically actuated

The unit consists mainly of

- a lubricant pump in the form of a pneumatically actuated piston pump with spring reset,
- suction valve,
- combination pressure and relief valve,
- lubricant reservoir in the form of a bellows, including protective holder,
- filler socket for topping up the lubricant reservoir.

### Function

The delivery piston is moved in the direction of the outlet after pressurization with compressed air. As a result, the lubricant that flowed into the pump chamber through the suction valve is delivered to the system via the combination pressure and relief valve.

After the compressed air is switched off the delivery piston is returned to its initial position by the reset spring. Due to the resulting underpressure the combination pressure and relief valves also returns to its initial position, thereby opening the pressure relief bore; the pressure in the main line is relieved as a result.

Due to the pressure relief the paths from the metering chambers to the friction point are opened in the distributors so that the spring-loaded metering pistons can now deliver lubricant to the friction point.

The inlet valve is opened by the underpressure resulting from the return motion of the piston, and new lubricant flows into the pump chamber.

This ends the work cycle.

### Please note

When filling for the first time, overfill the pump unit in order to keep air from becoming trapped in the bellows and to assure faultless operation.

### Technical data

Order No. ....	PEF-90
Delivery rate per stroke ....	48 cm <sup>3</sup>
Operating pressure (depending on air pressure) ....	22 to 50 bars
Max. perm. P1 air pressure for the pump ....	10 bars
Permissible operating temperature ....	-25 °C to +80 °C

## Electronic control unit IG502-2-E

for systems with KFU2-40, KFU6-20 gear pump units or PEF-90 piston pump

### Operating and display elements

The IG502 control units come with an operating and display panel that can be used to check, monitor and, if necessary, readjust the parameters as well as programmed functions.

### Modes of operation

#### PAUSE (pump OFF) with timer function

- programmable from 0.1 to 99.9 h
- digital display after invoking:  
tPA (t = timer, PA = PAUSE)

The PAUSE (the interval between two lube cycles) is determined by a clock cycle (timer) generated by the control system and by the value (in hours) programmed for PAUSE (tPA).

#### PAUSE (pump OFF) with counter function

- programmable from 1 to 999 pulses
- digital display after invoking:  
cPA (c = counter, PA = PAUSE)

The PAUSE (the interval between two lube cycles) is determined by the interval between the times signals arrive at the counter input and by the value programmed for PAUSE (cPA).

#### CONTACT (pump ON) with timer function

- programmable from 1 to 99.9 minutes
- digital display after invoking:  
tCO (t = timer, CO = CONTACT)

The pump running time (CONTACT) is determined by a clock cycle (timer) generated by the control system and by the value (in minutes) programmed for CONTACT (tCO).

### Monitoring functions

#### PS (Pressure Switch)

This monitoring function is intended for centralized grease lubrication systems designed for NLGI grades 000, 00, 0 in which the pressure in the main line is monitored. Once the monitoring parameter **PS** has been programmed, the pressure switch installed in the main line is monitored for respective signals while the pump is in operation.

#### CS (Cycle Switch)

This monitoring function is intended for centralized grease lubrication systems with progressive feeders in which a piston's motion is monitored with a cycle switch.

Once the monitoring parameter **CS** has been set, the cycle switch installed on the progressive feeder is monitored for the respective signal while the pump is in operation.

The respective monitoring parameter selected (**PS** or **CS**) is displayed by the lighting of the corresponding LED in the PAUSE (interval) mode.

#### Without monitoring (OFF)

The monitoring can also be switched off (OFF).

The control system then works without direct monitoring of the pressure build-up in the main line or without monitoring of the feeder's operation. The **PS** or **CS** LEDs do not light up.

### Fault displays

The red FAULT LED shows a group fault signal when it constantly burns. The cause of the fault signal is additionally shown on the digital display to help with troubleshooting.

The following messages are provided for:

- FPS** – pressure build-up fault when monitoring is effected with a pressure switch.
- FCS** – cycle switch fault when a progressive feeder is not working or is blocked (line break).

### Special functions

Control units comprising the IG502 group have two electronic counters in which times are permanently stored; they cannot be changed by the user.

These counters are used to check the operation of the centralized lubrication system and are read out via the LED display.

#### Fault-hours counter

The amount of time a farm or construction machine has been run with a non-functioning centralized lubrication system (e.g. with no lubricant in the reservoir) is added up by the fault-hours counter.

The counter's contents are automatically updated and cannot be cleared. The current state of the counter can be displayed by invoking function parameter **Fh** on the display and operating panel. The current value is displayed in hours.

The counter has a resolution of 0.1 hour, i.e. the smallest displayable interval amounts to 6 minutes.

### Elapsed-hours counter

The electronic elapsed-hours counter adds up the time in which power is applied to the control unit.

The counter's contents are automatically updated and cannot be cleared. The current state of the counter can be displayed by invoking function parameter **Oh** on the display and operating panel. The current value is displayed in hours.

The counter has a resolution of 0.1 hour, i.e. the smallest displayable interval amounts to 6 minutes.

The units meet the legal requirements of the applicable EC Directives.

The unit is EC Type Approved (e1).

### Application

The IG502-2-E universal control unit is used to control and monitor centralized lubrication systems on commercial vehicles. The control unit's functions can be programmed. Its housing dimensions, electrical connection and functions are compatible with those of SKF control units in use to date.

The operating elements are protected by a foil against moisture and dirt. The unit has a voltage-independent data memory. This is where the configuration data and parameters are stored. As a result, the control unit is not dependent on a constant supply of voltage.

If an external indicator light SL has been installed in the driver's cab, it will light up for 3 seconds after the unit is switched on.

### Installation

The unit has to be installed in a closed compartment on the vehicle where it is protected from ambient influences. It is fastened in place with straps.

The IG502-2-E is accommodated in an IP 20 type of enclosure. The plug conforms to safety class IP 00.

If the control unit is installed in a hard-to-reach place, it is advisable to additionally install an illuminated pushbutton on the dashboard to serve as a fault display and function check.

including IG476-2 electronic control unit  
for use on vehicles carrying hazardous goods

### Functional sequence

The switching pulses for the stop light are registered and added in the electronic control unit at an interval of at least one second. As soon as the preset number of brake applications is reached, the pulse-controlled 3/2-way solenoid valve is energized for a lubricating time of at least 40 seconds, thereby pressurizing the compressed air cylinder of the piston pump. The delivery piston of the pump executes one working stroke, the lubricant distributors are filled (relubrication distributors).

Application of the brakes during the lubricating time is ignored.

The first application of the brakes at the conclusion of the lubricating time reverses the valve. As a result, the compressed air cylinder of the piston pump is relieved of pressure, and the delivery piston returns to its initial position. At the same time, this relieves the pressure in the main line so that the distributors can now deliver the lubricant.

Further applications of the brakes are now registered and added again.

The control unit is equipped with an EEPROM memory that stores the counter states, even when no power is applied between applications of the brakes.

The number of times the brakes have to be applied before lubrication takes place depends on the conditions in which the vehicle is operated. It is possible to set the number of times (20, 40, 60, 80, 100, 120, 140, 160, 180, 200, 220, 240) after which lubrication is initiated. After changing the setting it is advisable to trigger manual lubrication so that the counter begins at 0 again.

The unit is set at the factory for 100 applications of the brakes.

A pushbutton is built in for function tests when the brakes are applied. The function test can only be performed when there is adequate air pressure (more than 6 bars) in the air tank and power is available!

IG476-2

KFB/KFBS compact unit, electrically operated

The KFB/KFBS compact unit consists mainly of a gear pump with DC gear motor, relief and safety valve, control unit, pushbutton for manual triggering and lubricant reservoir.

The lubricant reservoir comes with an overfill release valve and vent. The filling level can be seen in the reservoir made of transparent material. The reservoir is filled via a filler.

The lubricant supplied by the pump is distributed to the individual lubrication points via VKSO piston distributors.

The KFBS pump unit is controlled by the integrated IG502-I control and monitoring unit. This can be done on a time or (pulse) load-dependent basis, with or without monitoring of the system's pressure build-up. A pressure switch <sup>1)</sup> has to be installed in the system for this purpose.

1) Pressure switch for 20 bar switching pressure, order No. DS-E20-S1 (when installed at end of main line);  
for 25 bar switching pressure, order No. DS-E25-S1 (not possible when installed at end of main line).  
Associated cable harness for pressure switch, order No. 997-000-379.

Function

The automatic cycle consisting of the interval time and pump running time is started after the KFB/KFBS unit has been connected to the vehicle's electrical system and the ignition turned on.

When the ignition is on, the pump motor is switched on at the end of the interval time and the pump running time started. During the pump running time the gear pump delivers lubricant from the reservoir to the metering chambers of the relubrication distributors. As soon as the metering chambers of the distributors are full the surplus lubricant flows back into the reservoir via the safety valve.

Forced pressure relief is initiated at the end of the pump running time (beginning of the interval time), the pressure in the distributor feed (main line) drops to a residual pressure of 0.2 to 1 bar via the open relief valve.

The spring-loaded pistons of the distributors can now deliver lubricant from the metering chambers to the lubrication points.

A new interval time sequence is started when the pump motor is switched off.

The interval time stops running down every time the ignition is switched off. The interval time continues to run down when the ignition is turned on again.

All further lubrication operations are repeated on a cyclic basis in the order described.

## Piston distributors, group VKSO (relubrication distributors)

VKS02

VKS04

VKS06

The distributors meter and distribute the lubricant from the pump to the individual lubrication points. They do so independent of each other.

Interchangeable metering nipples make it possible to adapt the quantity to the amount of lubricant required by the friction point.

The cycle number, i.e. the number of pump strokes per time unit of the lubrication system, also permits further coordination of the lubricant quantity with the friction point and entire system.

Lubricant is only delivered under spring pressure after the end of pump operation, i.e. after the pressure is relieved.

A collar (changeover valve) in the distributor closes the outlet to the lubrication point

during the delivery stroke, thus storing the lubricant beneath the piston. The changeover valve opens the outlet as soon as the pressure drops in the main line, i.e. when the pressure relief valve of the pump opens.

When installing a system, arrange the lines and distributors in such a way that any air entrained in the system can escape by itself via the lubrication points.

For this purpose, distributors with horizontal outlet ports or with outlet ports pointing upward must be installed at a position suitable for bleeding of the entire system.

Assign only one lubrication point to each distributor outlet port.

Connect the secondary line (connection: distributor – lubrication point) to the lubrica-

tion points only after bubble-free lubricant emerges from the tubing after the pump is repeatedly actuated. Fill long secondary lines beforehand if necessary.

The metered quantity can be seen from the shape of the metering nipple and code number.

Distributors are connected to manifolds with a connector, order No. VKR2.U2

Individual distributor outlet can be closed with plug pin 450-204-002 and thus shut down. Other metered quantities will not be affected by this step.

## Fittings and auxiliary equipment

### Screw unions for steel and plastic tubing (use reinforcing socket for plastic tubing)

for outer tube diam.	Reinforcing socket for plastic tubing Order No.	Tapered sleeves Order No.	Socket unions Order No.	d1
4x0,85	404-603	404-611	404-612-MS	M8x1
6x1,25	406-613	406-611	406-612-MS	M10x1
8x1,25	408-603	408-611	408-612-MS	M14x1.5
10x1,5	410-603	410-611	410-612-MS	M16x1.5

Material: brass

#### Assembly

Slide socket union and tapered sleeve onto end of the tube. In the case of plastic tubing, **first** insert the reinforcing socket. Insert end of tube into tapped port up to the stop. First tighten the socket union fingertight and then turn it another  $1\frac{1}{2}$  turns.

\*) The WVN716-R04x0.85 plastic tubing can be supplied in various colors and also filled with grease NLGI grades 000 or 00.

The following color key information to be added to the order No. applies in this case:

Color key	Color key – tubing filled with grease
A 87 = green	AF 1 = natural color
A 88 = red	AF 4 = brown
A 89 = black	AF 6 = black
A 90 = brown	AF 7 = red
without color key: natural color	AF 8 = green

## Order examples

Plastic tubing WVN716-R04x0.85, color black, 5 m long:

Order No. WVN716-R04x0.85+A89, 5 m

Plastic tubing WVN716-R04x0.85, color green, filled with fluid grease, NLGI grades 000 or 00, 8 m long:

Order No WVN716-R04x0.85+AF8, 8 m

## Important!

For plastic tubing joints only use unions with reinforcing sockets.

## Fittings and auxiliary equipment

### Hoses for main lines

(connection: pump – distributor)

L +5	Order No	Outer tube diam.	Hose diam.	Socket union thread
580	SLH10-580			
650	SLH10-650	10	14	M16x1.5
1600	SLH10-1600			

Material

inner liner: PA 11/12 or PE-E  
 reinforcement: 1 layer of braided, highly tear-resistant synthetic fiber

outer cover: PA 11/12

Please order tapered sleeves 410-611 and socket unions 410-612-MS separately.

### Multiple-line hose

(connection: distributor – lubrication point))

L +5	Order No.	Hose diam.

982-760-120	8	11.7 x 1.6	8.4	max. 100 m
982-760-130	10	12.9 x 1.5	10	up to
982-760-160	12	15.7 x 1.7	12.3	max. 50 m

Material: polyamide 6; color: black

\*) Please quote when ordering.

Hose sleeves for protective hose 982-760-130 (rated width 10)

Order No.

2-hole: 898-210-047

3-hole: 898-210-075

4-hole: 898-210-063

## Fittings and auxiliary equipment

### Tube cutter

with formation of claw groove for 4 mm diam. quick tube connectors

Order No. 169-000-336

Order No. 169-000-301

Order No. for cutting wheel: 844-300-001

Shears for plastic tubing

Order No. 169-000-090

### Pulse valve

Please note:  
Use the pulse  
valve only with  
control units  
IG476-2 or  
IG476-3.

Order No. 995-800-166

### Solenoid valve

Order No. 995-800-550

Type of enclosure ..... IP 65  
Ambient temperature ..... -40 °C to +80 °C  
Flow rate ..... 66 Nl/min  
Voltage ..... 12 / 24 V DC  
(please quote when ordering)  
Power input ..... ~ 10 W  
Mounting position ..... any

Cable harness, length 3 m, order No. 997-000-712

Connector, complete without cable, order No. 997-000-702

### Overflow valve without return flow

Order No. 232-100-001

Operating pressure ..... max. 10 bars  
Permissible medium ..... air  
Temperature range ..... -40 °C to +80 °C  
Rated width ..... 8 mm  
Overflow pressure <sup>1)</sup> ..... 6 bars

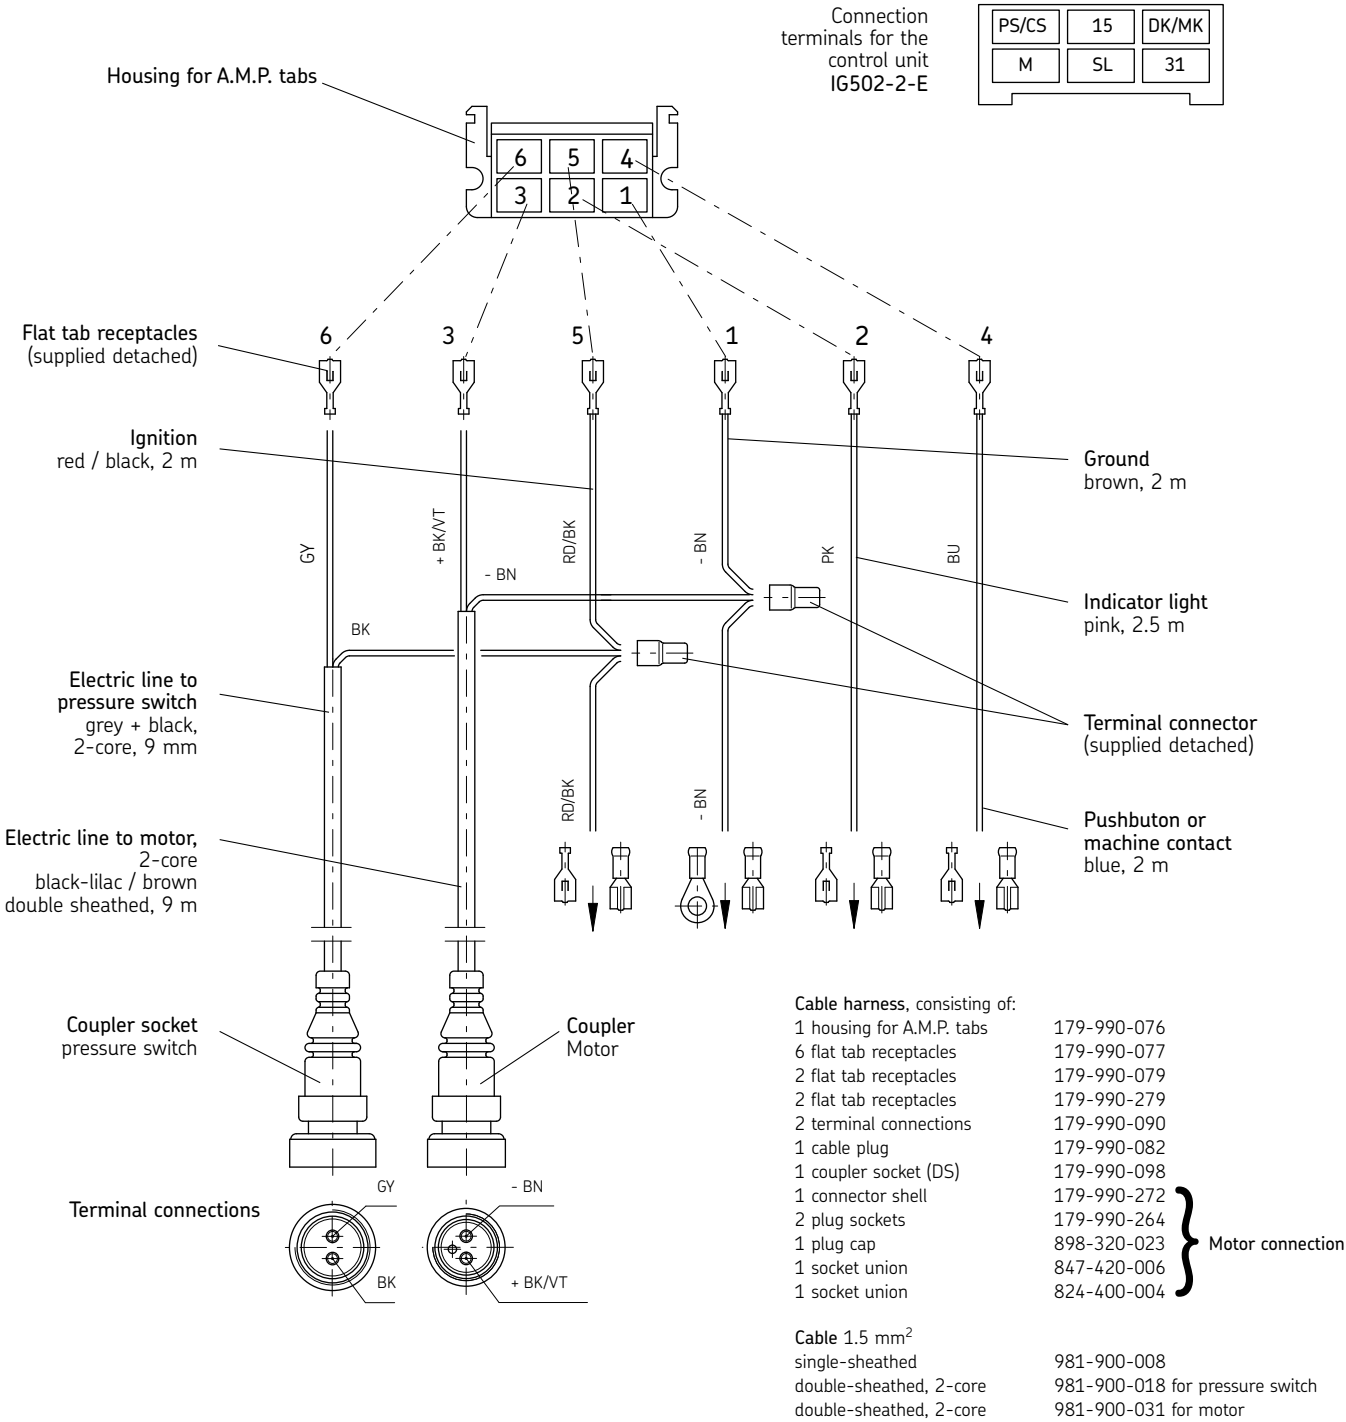

1) The secondary units are not supplied until a pressure of more than 6 bars reached in the main tank.

Fittings and auxiliary equipment

Cable harness for systems with KFU2-40, KFU6-20 gear pump units

Order No. 997-000-373

## Fittings and auxiliary equipment

### Cable harness for systems with KFU2-40, KFU6-20 gear pump units used on vehicles carrying hazardous goods

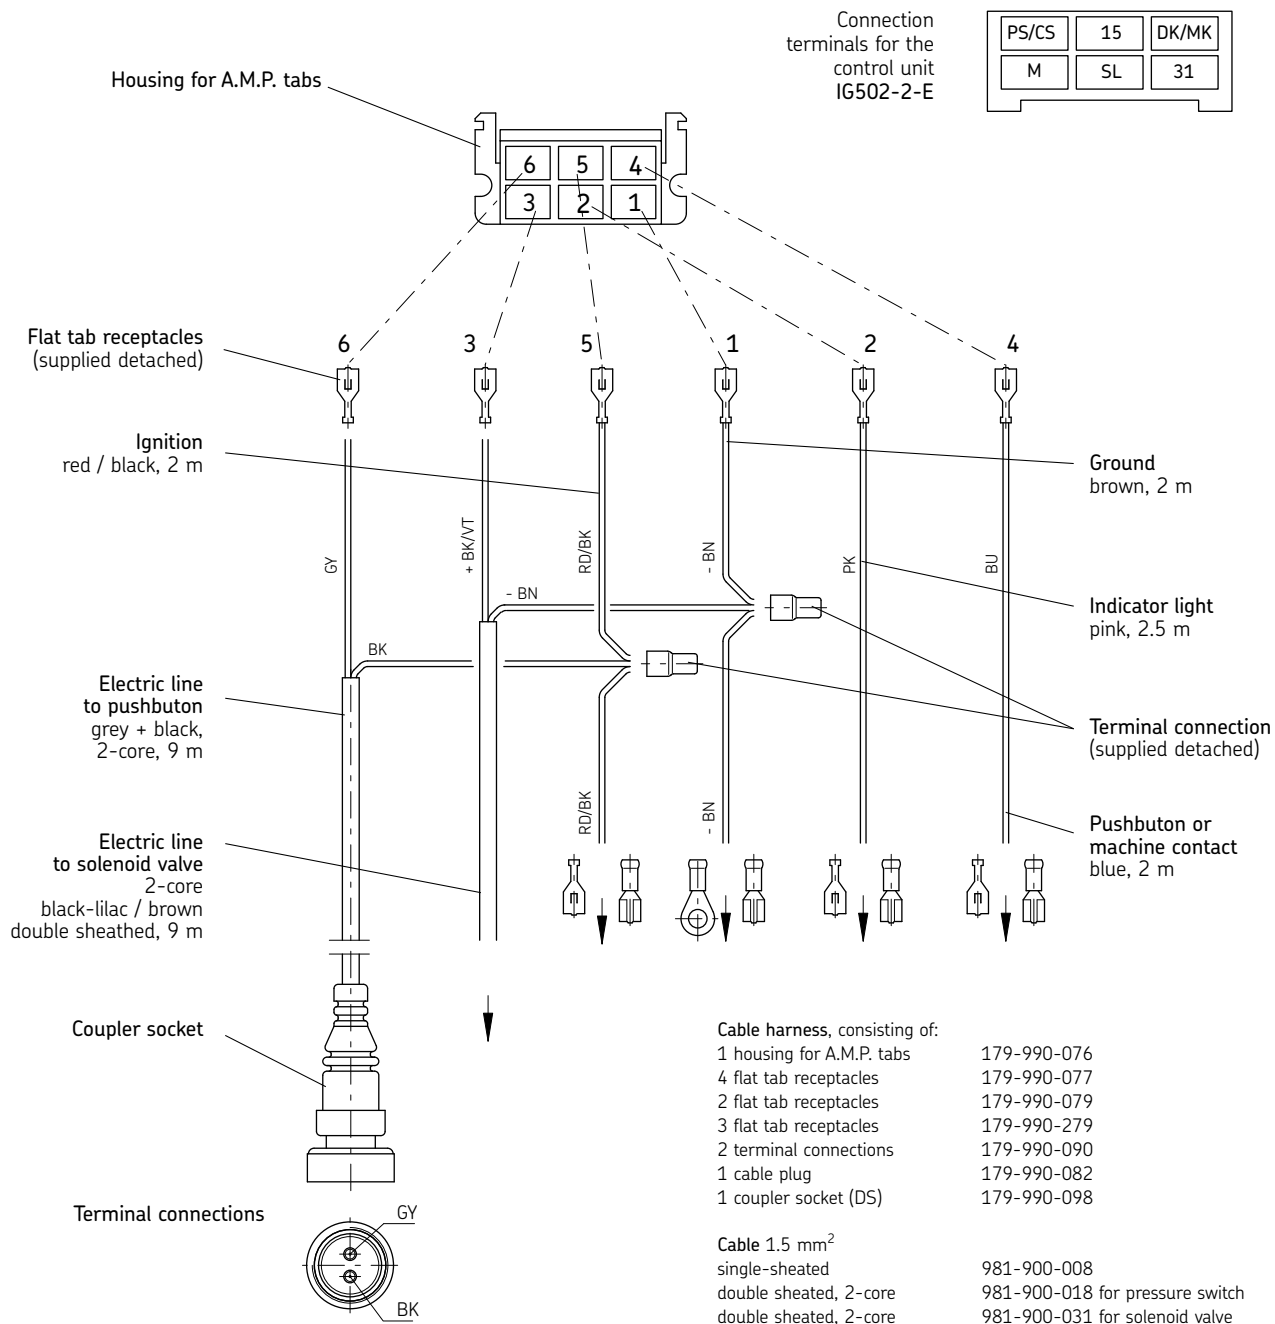

Order No. 997-000-374

## Fittings and auxiliary equipment

### Cable harness for systems with PEF-90 piston pump

Order No. 997-000-189

## Fittings and auxiliary equipment

### Operating instructions

Open the grease drum and place the cover of the topping-up pump on the drum. Insert the suction tube in the opening in the cover, push down to the bottom of the grease drum and secure with the lock screw.

Use a clean cloth to thoroughly clean the filler socket of the vehicle pump and filler coupling of the grease pump after removing the protective caps. Now connect the coupling of the topping-up pump to the filler socket of the vehicle pump. The hose coupling must snap into place when connected.

Actuate the lever of the topping-up pump until the reservoir of

the vehicle pump is filled to within **approx. 1 cm of the top edge** (max. marking on reservoir).

When the reservoir is full remove the coupling from the pump and put the protective cap back on the filler socket. Slip the coupling half of the topping-up pump onto the respective holder.

Coupling bush for topping-up connection, **order No 995-001-500**.

### Filler socket

Order No. 995-000-705

Respective coupling socket  
Order No. 995-001-500

### Coupling socket for topping-up port

Order No. 995-001-500

Respective plug  
Order No. 833-370-001

Connection piece with  
hose socket NW 16  
Order No. 857-870-002

### Coupler for grease drum FL1-000

Order No. KFU2.U8

### Topping-up pump with trolley

Order No. 169-000-082

Can be used for grease drum ..... FL25-000 and FL25-000-BIO  
Max. internal diameter ..... 340 mm  
Max. height ..... 400 mm  
Capacity ..... 25 kg  
Pump output ..... 0.1 l / stroke  $\pm 10\%$

### Topping-up pump without trolley

Order No. 169-000-084

Can be used for grease drum ..... FL25-000 and FL25-000-BIO  
Max. internal diameter ..... 340 mm  
Max. height ..... 450 mm  
Capacity ..... 25 kg  
Pump output ..... 0.25 l / double stroke

# Connection of compressed air supply line to the compressed air system of a vehicle for a pneumatically operated centralized lubrication system

- Observe the regulations of the Technical Control Board (Technischer Überwachungsverein) when connecting the air supply for the centralized lubrication system.
- The air supply line may only be connected to an air tank or to a line for secondary loads.
- The compressed air for the centralized lubrication system must be clean and dry.

The following check should be made to ascertain whether the air supply line has been connected at a place conforming to the safety regulations:

Open the air line to the centralized lubrication system so that the air can escape.  
The air pressure indicated on the pressure gauge in the driver's cab must not drop below 5.5 bars; the airbrake pressure is thus maintained as prescribed.

## For trailers with laminated leaf springs

Air connection at the air tank with safety valve (without return flow)

	Order No.
Safety valve	232-100-000
Tee connector with test connection	491-900-001
Straight connector	441-006-432
Back-up ring	847-400-004
O-ring	971-020-250

## For trailers with air suspension

Air connection at the air tank for secondary line loads

with straight connector

	Order No.
Straight connector	441-006-432
Back-up ring	847-400-004
O-ring	971-020-250

branch of air connection with tee piece

	Order No.
Tee piece	408-407
Reducing connector	408-406

#### Order No. 1-9420-EN

Subject to change without notice! (07/2009)

#### Important product usage information

All products from SKF may be used only for their intended purpose as described in this brochure and in any instructions. If operating instructions are supplied with the products, they must be read and followed.

Not all lubricants are suitable for use in centralized lubrication systems.

SKF does offer an inspection service to test customer supplied lubricant to determine if it can be used in a centralized system. SKF lubrication systems or their components are not approved for use with gases, liquefied gases, pressurized gases in solution and fluids with a vapor pressure exceeding normal atmospheric pressure (1013 mbars) by more than 0.5 bar at their maximum permissible temperature.

Hazardous materials of any kind, especially the materials classified as hazardous by European Community Directive EC 67/548/EEC, Article 2, Par. 2, may only be used to fill SKF centralized lubrication systems and components and delivered and/or distributed with the same after consulting with and receiving written approval from SKF.
